

The Collecting of your medical information  
in one accessible place

Why?	How?	Accessibility	Dangers	difficulties/security needed
Many of the medical facilities are changing to online reports.	One option is to develop a phone app	A dark made and a color-blind mode for comfort	Your medical information may be a little more vulnerable if security is lacking	There would be very tight security that would be needed because it would have your personal medical information
This may prove a problem when people need to combine their medical history.	A online website maybe	emergency responders should have a way to get in and see any outstanding medical concerns or allergies	Security breaches could endanger the information	A timer on how long devices can stay on the network
Private doctors can diagnose you with conditions that would need to be treated in an emergencies	A list of concerns and medical information	Connecting it to a network so you can log into it from multiple devices.	losing the device that has access to the system	A way to cut devices off from people's information
Examples: Asma Heart Problems Allergies	How to treat concerns of certain medical conditions in an emergency	Emergency cervices could have a secure way to access the information in an emergency	information leaks or temporary information getting old	figuring out how to update temporary information like healing injuries
